General conclusions are drawn which reflect the concept as to the appearance, localization and spread of the process of conditioned inhibition. We attribute to conditioned inhibition as its basic quality the capacity to form a specific, integrated, biologically negative process with all action components which specifically pertain to it. Each external stimulus, upon attaining definite intensity, is bound to make some correspond-

DESCRIPTORS: *Differential equations, Complex variables, Numerical analysis.

A system of ordinary differential equations is discussed, where the derivatives of the "rapidly-oscillating" variables are included with a small parameter, ϵ . "Averaged" equations are introduced, which describe, approximately, the variation of the slowly varying variables. It is shown that, as $\epsilon \rightarrow 0$, these variables, computed from the initial system of differential equations, converge to the solution of the averaged system. The solubility curves for $Mg(OH)_2$ and of
 $Mg(OH)_2 \cdot 4H_2O$ in magnesium chloride solutions
were determined on the basis of a renewed study of
the 20°C isotherm in the system $H_2O-Mg(OH)_2-$
 $MgCl_2$. The preparation of anhydrous $Mg_2(OH)_3Cl$
was investigated as well. Some of the properties of this
compound are reported. (Author)
